

Trident Technical College (TTC) is conducting market research to gather information for a managed disaster recovery provider capable of hosting its critical systems in the event of a disaster.

TTC currently lacks a fully managed disaster recovery environment capable of hosting its critical systems—serving over 10,000 students across three campuses—in the event of a disaster. Existing backup-only strategies do not provide system availability within acceptable Recovery Time Objectives (RTOs). Without a robust DRaaS solution, TTC risks extended outages, jeopardizing academic continuity, administrative operations, and student services.

The proposed solution must provide a co-located restore environment where at least 30 x86 and 10 IBM Power workloads operate seamlessly together, ensuring compatibility with TTC's existing infrastructure.

Additionally, the proposed solution must include rack space for dedicated firewalls and backup appliances managed and owned by TTC to ensure security and control, internet bandwidth and IPv4 resources to support hosting our services.

If you wish to provide information regarding a managed disaster recovery environment capable of hosting its critical systems, please contact:
